

Circuit simulation

Create a program that simulates the seizure and release of resources in the topology and capacities specified in the JSON file
and based on needs!

For testing json file: [cs1.json](#)

Script parameterization: `python3 client.py cs.json`

Output of the program:

- event number. < event name >: < node1 > <-> < node2 > st:< simulation time > [- < succes

For example:

1. request booking: A<->C st:1 – successful
2. request booking: B<->C st:2 – successful
3. need release: A<->C st:5
4. request booking: D<->C st:6 – successful
5. request booking: A<->C st:7 – failed
- ...

Drop-off: Submit the program through the TMS system **.zip** format, in which one **client.py** be included!

#####

Circuit simulation

Write a program that simulates the allocation and deallocation of resources according to the topologies, and demands outlined in the given JSON file!

JSON file for testing: [cs1.json](#)

Parameters of the script: `python3 client.py cs.json`

Structure of the output:

- event number. < event name >: < node1 > <-> < node2 > st:< simulation time > [- < succes

Ex.:

1. demand allocation: A<->C st:1 – successful
2. demand allocation: B<->C st:2 – successful
3. demand deallocation: A<->C st:5
4. demand allocation: D<->C st:6 – successful
5. demand allocation: A<->C st:7 – unsuccessful
- ...

Submission: Send it to the TMS in **.zip** file should contain one and only one file called **client.py**!
